1 Introduction

Other suggestions for titles: - The Collaboration Gradient: Seniority, Centrality, and Intersectional Sorting
- Crossing Lines, Climbing Ladders: Intersectional Inequality in Co-Publishing Networks - Privileges in Print: Unequal Returns to Popularity Across Intersectional Strata

RQ1: *Do scholars preferentially form new co-publishing ties within their intersectional stratum (gender $\times$ nationality $\times$ position), and is this within-stratum preference weaker when potential alters are high-status (central and/or senior)?*

RQ2: *Are gender, nationality, and seniority preferences symmetric, or do majority/men show stronger same-group collaboration than minority/women—and how does gender $\times$ nationality shape boundary crossing?*

RQ3: *Do intersectional groups convert current popularity (indegree) into future in-ties equally, or do some strata gain more from being “popular”?*
